Enclosed are:

Application Elements

1. ☒ Filing fee as calculated and transmitted as described below
2. ☒ Specification having 22 pages and including the following:
 - a. ☒ Descriptive Title of the Invention
 - b. ☒ Cross References to Related Applications (if applicable)
 - c. ☐ Statement Regarding Federally-sponsored Research/Development (if applicable)
 - d. ☐ Reference to Microfiche Appendix (if applicable)
 - e. ☒ Background of the Invention
 - f. ☒ Brief Summary of the Invention
 - g. ☒ Brief Description of the Drawings (if drawings filed)
 - h. ☒ Detailed Description
 - i. ☒ Claim(s) as Classified Below
 - j. ☒ Abstract of the Disclosure

DATE OF MAILING BY EXPRESS MAIL
EXPRESS MAIL Mailing Label Number EL 405 597 776 US
Date of Transmittal 1-31-00
This application is being deposited with the U.S. Patent and Trademark Office by Express Mail Post Office to the Assistant Commissioner for Patents, Washington, D.C. 20231.

Application Elements (Continued)

3. ☒ Drawing(s) (when necessary as prescribed by 35 USC 113)
- a. ☐ Formal Number of Sheets _____
- b. ☒ Informal Number of Sheets 2
4. ☒ Oath or Declaration
- a. ☐ Newly executed (original or copy) ☒ Unexecuted
- b. ☐ Copy from a prior application (37 CFR 1.63(d)) (for continuation/divisional application only)
- c. ☒ With Power of Attorney ☐ Without Power of Attorney
- d. ☐ DELETION OF INVENTOR(S)
Signed statement attached deleting inventor(s) named in the prior application,
see 37 C.F.R. 1.63(d)(2) and 1.33(b).
5. ☐ Incorporation By Reference (usable if Box 4b is checked)
The entire disclosure of the prior application, from which a copy of the oath or declaration is supplied under Box 4b, is considered as being part of the disclosure of the accompanying application and is hereby incorporated by reference therein.
6. ☐ Computer Program in Microfiche (Appendix)
7. ☐ Nucleotide and/or Amino Acid Sequence Submission (if applicable, all must be included)
- a. ☐ Paper Copy
- b. ☐ Computer Readable Copy (identical to computer copy)
- c. ☐ Statement Verifying Identical Paper and Computer Readable Copy

Accompanying Application Parts

8. ☐ Assignment Papers (cover sheet & document(s))
9. ☐ 37 CFR 3.73(B) Statement (when there is an assignee)
10. ☐ English Translation Document (if applicable)
11. ☐ Information Disclosure Statement/PTO-1449 ☐ Copies of IDS Citations
12. ☒ Preliminary Amendment
13. ☒ Acknowledgment postcard
14. ☒ Certificate of Mailing
- ☐ First Class ☒ Express Mail (Specify Label No.): EL 405 597 776 US

Serial No. Unknown

Filed: Herewith

For: METHOD OF MAKING FLUOROCARBON COATED
BRAIDED HOSE ASSEMBLIES

Attorney Docket No.: 0153.00084

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Please preliminarily amend the above-captioned application prior to examination on the merits. Please amend the application as follows:

IN THE SPECIFICATION:

Page 1, before the "BACKGROUND OF THE INVENTION", please insert the following subparagraph:

-- CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of United States Serial No. 08/931,018, filed September 15, 1997, which is a continuation of United States Serial No. 08/259,343, filed June 14, 1994, which is now abandoned, which is a continuation of United States Serial No. 08/023,417, filed February 23, 1993, which is a continuation-in-part of United States Serial No. 08/764,460, filed September 24, 1991, now abandoned.--

In the Preliminary Amendment dated February 23, 1993, Page 2, line 25, after "braided layer 13." please insert the following paragraph:

--In another embodiment of the present invention, the first and second dispersions or coatings can be made of different materials. This process allows for great flexibility in product design and adds various device functionalities and cost savings. For example, a first dispersion or coating can be used which promotes highly efficient bonding which is initially applied over the tubular member 12. Upon binding a braided or wound material 13 around the tubular member 12 and upon sufficient bonding of the two, the assembly is then dipped a second time into a different emulsion or coating. This emulsion or coating again can flow through any gaps in the braid and can attach to the previously applied dispersion on the tubular member 12. However, this material can be made of any additional material and does not have to be the same material as is utilized for the attachment of the braided or wound material 13 to the tubular member 12. Preferably, the outer layer can be applied for its use in resistance to abrasion, flexibility, UV resistance, add a different color to the hose assembly 10 or provide any additional property required for the specific hose assembly 10.

Typical pairs of coatings are:

- (a) a first dispersion including high solids and a second, less expensive, dispersion with lower solids;
- (b) a first dispersion for adhesive property and a second dispersion for anti-abrasive property;
- (c) a first layer for adhesive property and a second layer for adding a preferred color.

Examples of the specific types of dispersion or coatings include the following: silicone, polyester, PPS, TFE, amides, aramids, fluorocarbon polymers, paint, and polyamides. These coatings and additives can be used for specific purposes such as affording resistance to abrasion so long as the coating or additive is able to survive further processing steps, consideration must be made for temperature, reaction with the other reagents, coatings and braid as well as end use considerations. This list is not meant to be exhaustive but instead is meant to provide examples of some coatings and additives which can be used in the present invention. Other coatings or additives which are known to those of skill in the art can be used so long as these additives or coatings are able to survive further processing.

IN THE CLAIMS:

Please delete claims 2-7, 10-13 and 15-17.

Please add the following new claims:

21. (New) A method for constructing a hose assembly comprising the steps of:

extruding an inner tubular liner (12) of a fluorocarbon polymer;

applying a dispersion consisting essentially of a fluorocarbon polymer material over the tubular liner (12);

positioning a braided layer (13) about the exterior of the inner tubular liner (12) and over the applied dispersion;

applying a second dispersion including a fluorocarbon polymer material (14) therein to the braided layer (13) in the inner tubular liner (12) which bonds to the inner tubular liner (12) and a first applied dispersion, whereby the first and second dispersion have a different composition.

22. (New) A hose assembly comprising:

an inner tubular liner (12) of a fluorocarbon polymer;

a dispersion comprising a fluorocarbon polymer material applied to said inner liner (12);

a braided layer (13) positioned about the inner liner (12) whereby said dispersion prevents relative movement of the braided layer (13) to the inner liner (12); and

a second dispersion comprising a fluorocarbon polymer material applied to said braided layer (13).

23. (New) The hose assembly according to claim 22, wherein said first dispersion is selected for the group consisting of a fluorocarbon polymer, silicone and other dispersions capable of bonding the braided layer to the inner liner.

24. (New) The method according to claim 22, wherein said second dispersion is selected for the group consisting of a fluorocarbon polymer, silicone, polyester, polyamides, PPS, paint and other dispersions capable of providing additional function to the hose assembly.

25. (New) The hose assembly according to claim 22, wherein said first dispersion comprises a fluorocarbon polymer material and a surfactant.

26. (New) The hose assembly according to claim 25, wherein said first dispersion further includes at least one curing agent.

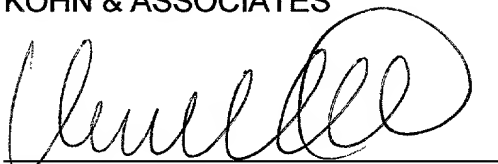

REMARKS

Claims 1, 21-26 remain in the application. Only Claims 1, 21, and 22 are in independent form.

The application is in condition for allowance, which allowance is respectfully solicited.

Respectfully submitted,

PRELIMINARY AMENDMENT

Hon. Commissioner of Patents
and Trademarks
Washington, D.C. 20231

Valerie Lyons
February 23, 1993

Dear Sir:

This Preliminary Amendment is responsive to the
Office Action dated October 9, 1992. Please amend the
application as follows.

IN THE SPECIFICATION:

Page 1, before "Technical Field", please insert the
following paragraph --This application is a continuation-in-
part of U.S. Serial No. 764,460, filed September 24, 1991.--

Page 7, line 6, before "Summary of the Invention",
please insert the following paragraph --The above-cited co-
pending patent application provides a method for making a
coated, braided hose assembly. Further development has
determined that in order to conform the coating of the braid
to the fluorocarbon tube, additional steps need to be taken.
For example, pre-coating of the tube with a fluorocarbon

tube with a fluorocarbon emulsion is desirable. However, the emulsion, which is waterbased, tends to bead up on the tube thereby proving a non-uniform layer.

The present invention provides a method for solving the aforementioned problem and providing an improved coated, braided hose assembly.--

Page 15, line 8, please delete "A non-metallic or wound material (preferably glass fiber) is then braided or wound about the exterior of the inner liner 12 to form a braided layer 13."; and insert the following --A dispersion containing a fluorocarbon polymeric material, curing agent, and surfactant therein is initially applied over the tubular member. The surfactant causes the dispersion to evenly coat the outer surface of the tubular member 12. A non-metallic or wound material (preferably glass fiber) is then braided or wound about the exterior of the inner liner 12 to form a braided layer 13. The assembly is then dipped a second time in emulsion of the fluorocarbon polymeric material and curing agent, (with or without surfactant therein) which flows through the gaps in the braid and attaches to the previously applied inner layer and tubular member 12.

An alternative method is as follows. The non-metallic or wound material is braided or wound about the exterior of the inner liner 12 directly to form a braided layer 13.--

IN THE CLAIMS:

Please amend claim 1.

1. (AMENDED) A method for constructing a hose assembly comprising the steps of:

providing an inner tubular liner (12) of a fluorocarbon polymer;

applying a dispersion including a fluorocarbon polymer material and a surfactant therein over the inner tubular liner (12);

positioning a braided layer (13) about the exterior of the inner tubular liner (12) and over the applied dispersion; and

[said method characterized by the steps of;]

applying a second dispersion including a fluorocarbon polymer material (14) therein to the braided layer (13) and the inner tubular liner (12)[; and] which bonds to the inner tubular liner (12) and first applied dispersion.

[applying a surfactant to the hose assembly (10) for distributing the dispersion throughout the braided layer (13) and about the inner tubular liner (12).]

REMARKS

Claims 1 through 20 remain in the application.
Claim 1 is the only claim in independent form.

This Supplemental Amendment is being made to correct the errors of the page numbers and line numbers in the specification where the amendments are to be made.

This application is a continuation-in-part of U.S. Serial No. 764,460, filed September 24, 1991.

It is respectfully submitted that the application is in condition for allowance, which allowance is respectfully requested.

Respectfully submitted,

REISING, ETHINGTON, BARNARD,
PERRY & MILTON

BACKGROUND OF THE INVENTION

1). Technical Field

5 The subject invention relates to a method
for constructing hose assemblies. More
specifically, the subject invention relates to a
method for constructing hose assemblies having an
inner fluorocarbon liner supported within a glass
10 braided layer. The glass braided layer includes a
fluorocarbon polymer coating dispersed
therethrough.

2. Description of the Related Art

15 Hose assemblies used for carrying fuels
are well-known in the art. Such hose assemblies
should preferably be strong and resistant to heat
and chemical degradation. These hoses are subject
to chemical breakdown due to exposure to the
20 various fuels which flow through them. Further,
these hoses are typically routed through the engine
compartments of vehicles to deliver fuel to the
engines. These engines are hot and thus, the hoses
used to carry fuels are subject to thermal
25 breakdown from the heat.

30 TEFLON hoses provide the necessary
physical properties for carrying fuels. A major
drawback with these types of hoses however, is that
when used alone, i.e., only a TEFLON liner or
conduit, they tend to become bent during
installation resulting in a kink. This kink or
deformation remains permanent and provides constant
35 resistance to fluid flow through the hose. To

5 solve this problem, hose assemblies have been
constructed which include an inner TEFLON tubular
member surrounded by a tightly wound metallic
braid. The metallic braid allows the TEFLON inner
tubular member to bend to a certain degree without
kinking. However, if bent past a certain point,
the metallic braid aids in the kinking of the inner
tubular member. This type of assembly has three
major disadvantages. First, the metallic braid
10 tends to abraze the exterior of the inner tubular
member. This causes leaks from the inner tubular
member. The second problem is that the exterior
metallic braided casing is thermally and
electrically conductive. More important is that
15 the metallic braid will retain heat and transfer
the heat to the fuel moving through the inner
tubular member causing fuel system problems.
Finally, when used in an automotive environment,
the metallic braid transmits noise during operation
20 of the vehicle which is undesirable.

To avoid the problems associated with
metallic braided layers, the inner tubular member
may be supported within non-metallic braided
25 material. Although the substitution of non-
metallic braiding material avoids many problems
associated with metallic braiding, several problems
exist. First, hose kinking remains a problem due
to relative longitudinal movement between the inner
30 tubular member and the braided layer. That is, due
to relative slippage between the inner tubular
member and the braided layer, the hose assembly is
susceptible to kinking. Second, the hose assembly
is usually exposed to external heat and chemicals
35 and thus must be resistant to heat and chemical

degradation. Most non-metallic braiding materials do not provide the requisite heat or chemical resistance required. Third, hose assemblies generally encounter rough surfaces after installation; that is, they rub up against engine components. Accordingly, due to exposure to frictional movement, the hose assembly must be resistant to abrasion.

Copending application United States serial number 657,084 filed February 19, 1991 and its copending divisional application United States serial number 416,151 filed October 2, 1989 (which is a continuation-in-part of United States serial number 305, 643 filed February 2, 1989 and now abandoned), which are all assigned to the assignee of the subject invention, disclose a method for making a coated, braided hose assembly. The method comprises the steps of extruding an inner tubular liner of a polymeric fluorocarbon material and subsequently braiding glass fibers about the exterior of the liner. The inner tubular liner and the braided layer are then passed through a reservoir containing an aqueous solution of a fluorocarbon polymer. The solvent water is later removed from the hose assembly, leaving a fluorocarbon polymer coating dispersed throughout the braided layer.

Copending application United States serial number 535,734, filed June 11, 1990, is a continuation-in-part of United States serial number 244,319 filed September 8, 1988, now abandoned, and discloses a hose assembly comprising an inner tubular liner of a fluorocarbon polymer including

a fabric braided layer disposed thereabout. An outer foam layer may be disposed about the braided layer. The assembly additionally includes a conductive strip formed on the inner liner for dissipating electrical charges accumulating along the inner liner.

United States patent number 4,311,547 to Biggs et al discloses a hose assembly including an inner rubber liner having a reinforcement layer braided therearound. A solidifiable liquid polymer is embedded into the interstices of the reinforcement layer so as to bond the inner rubber liner to the reinforcement layer braided thereabout. The solidifiable liquid polymer may comprise plastisol, aldehyde, epoxy, or isocyanate resins. A cover layer may be disposed about the reinforcement layer and bonded thereto by the solidifiable liquid polymer. The cover layer may comprise the same material as that which unites the reinforcement layer and the inner liner, that is, in addition to bonding the inner rubber liner to the reinforcement layer, the solidifiable liquid polymer may also act as the cover layer. Although the solidifiable liquid polymer does in fact bond the inner liner to the reinforcement layer disposed thereabout, it does not sufficiently resist abrasion, and heat and chemical degradation.

United States patent number 4,215,384 to Elson discloses a hose construction and method for making the same. The hose assembly includes an inner organic polymeric liner having a braided material disposed thereover. The assembly further includes an outer coating of an organic polymeric

material. A conductive strip is disposed within the inner tubular liner for conducting electrical charges throughout the interior of the liner. The assembly further includes end fittings on each end of the inner liner for allowing fluid to be conducted therethrough.

United States patent number 4,007,070 to Busdiecker discloses a hose construction having an inner polymeric liner. The liner has a braided layer disposed thereover. An outer protective layer constructed from an organic polymeric material is disposed about the exterior of the braided layer. The Busdiecker '070 patent discloses the use of an adhesive to bond the inner liner to the braided material. The adhesive also coats the braided material for securing the braided material to an outer protective layer.

United States patent number 4,394,705 to Blachman discloses a hose assembly including an inner fluorocarbon liner including a reinforcing braided layer disposed thereabout. A cover layer having chemical and abrasion resistant properties is disposed about the braided layer thus protecting the inner liner and braided layer.

SUMMARY OF THE INVENTION AND ADVANTAGES

The present invention is a method for constructing a hose assembly comprising the steps of: providing an inner tubular liner of a fluorocarbon polymer and positioning a braided layer about the exterior of the inner tubular liner. The method is characterized by the steps

of: applying a dispersion, including a fluorocarbon polymer material therein, to the braided layer and the inner tubular liner and applying a surfactant to the hose assembly for distributing the dispersion throughout the braided layer and about the inner tubular liner.

An advantage of applying a dispersion having a fluorocarbon polymer material therein is realized by the resulting hose assembly's resistance to heat and abrasion degradation.

An advantage of applying a surfactant to the hose assembly is realized by a more even distribution of the dispersion throughout the braided layer and about the inner tubular liner. This results in a stronger bond between the inner tubular liner and the braided layer disposed thereabout. Thus, the hose assembly is more resistant to kinking. Additionally, due to the more even distribution of the dispersion, the resulting hose assembly is more resistant to abrasion and heat and chemical degradation.

BRIEF DESCRIPTION OF THE DRAWINGS

Other advantages of the subject invention will be readily appreciated when the same becomes better understood by reference to the following detailed description when considered in connection with the accompanying drawings wherein:

FIGURE 1 is a perspective view of the preferred embodiment of the subject invention;

FIGURE 2 is a side view partially broken away of the preferred embodiment of the subject

invention including a coupler member;

FIGURE 3 is a side view partially broken away of the preferred embodiment of the subject invention including an alternative coupling member; and

FIGURE 4 is an enlarged cross-sectional view of a hose assembly.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

A hose assembly, made in accordance with the subject invention is generally shown at 10 in the Figures. The assembly 10 includes a tubular member generally indicated at 11 and coupling means, generally indicated at 20 (as best viewed in Figures 2 and 3), for connecting the ends of the tubular member 11 to fittings for conducting fluid therethrough.

The tubular member 11 includes an inner organic, polymeric liner 12. The liner 12 is preferably extruded and has a wall thickness between 0.001 and 0.120 inches. The inner liner 12 is preferably made of a fluorocarbon polymer. Specifically, the inner liner is preferably made from the polymer of tetrafluoroethylene (PTFE), the polymer of fluorinated ethylene propylene (FEP), the polymer of perfluoroalkoxy resin (PFA), or the polymer of ethylene-tetrafluoroethylene (ETFE). The fluorocarbon polymers PTFE, FEP, and PFA are sold under the trademark TEFLON by DuPont. The polymer ETFE is sold under the trademark TEFZEL by DuPont.

The inner liner 12 is impervious to fluid

flow through the wall. Since the inner liner 12 is preferably made of a fluorocarbon polymer material, it is resistant to both heat and chemical degradation. This allows a variety of fluids, particularly vehicle fuels, to pass through the interior of the liner 12 without corroding the liner 12.

The assembly 10 further includes a braided or woven layer 13 disposed about the exterior of the inner liner 12. The braided or woven layer 13 can comprise any non-metallic material disposed in interleaving fashion or wrapped tightly about the inner liner 12. Preferably, the material used for the braided layer 13 is a glass fiber. Glass fibers provide the hose assembly 10 with the necessary strength. Further, glass fibers are heat resistant which is important for hose applications in heated environments and for making the subject hose assembly as will be described subsequently.

The braided or woven fibers may be tightly wound or they may be loosely wound about the inner liner 12, having wide gaps between adjacent fibers. In the preferred embodiment, the glass fibers are tightly woven such that the gaps or spaces between adjacent fibers is minimal. The braided layer 13 adds to the strength of the inner liner 12. Particularly, by using a braided layer 13, the working pressure of the inner liner 12 is increased, allowing a higher pressure of fluid to flow through the inner liner 12. Further, the braided layer 13 adds to the tensile strength of the hose assembly 10. When coupling members 20 are

disposed on the ends of the tubular member 11, as will be described subsequently, the braided layer 13 increases the tensile strength of the hose assembly 10 sufficiently to fixedly connect any type of coupling member 20 to the tubular member 11. Finally, the braided layer adds to the hoop strength of the inner liner 12.

The assembly 10 further includes a fluorocarbon polymer coating 14 dispersed throughout the braided layer 13 and about the inner liner 12. That is, the coating 14 is distributed within the interstices of the braided layer 13 forming a single layer therewith. The coating 14 is located from the outer periphery of the braided layer 13 radially inward toward the inner liner 12 (best shown at Figure 4). Preferably, the fluorocarbon polymer coating 14 is one of the following: the polymer of tetrafluoroethylene (PTFE), the polymer of fluorinated ethylene propylene (FEP), the polymer of perfluoroalkoxy resin (PFA), or the polymer of ethylene-tetrafluoroethylene (ETFE). Due to the properties of the fluorocarbon polymer material, the coating 14 provides the hose assembly 10 with the necessary resistance to both heat and chemical degradation while also bonding the braided layer 13 to the inner liner 12.

The coating 14 covers or coats the glass fibers of the braided layer 13. That is, the coating 14 covers the fibers of the braided layer 13 from the outer periphery radially inwardly. The coating 14, therefore, does not extend radially outward from the outer periphery of the braided

layer 13. After the material has been coated, each fiber is discernable. In effect, what results is a coating 14 having a braided layer 13 therein.

5 The coating 14 is preferably formed by first braiding or wrapping the braided material 13 about the exterior of the inner liner 12. A dispersion containing a fluorocarbon polymer material, carrying agent, and surfactant therein, is then dispersed throughout the braided layer 13 from the outer periphery of the braided layer 13 radially inward toward the inner liner 12. The dispersion preferably comprises 50-60% solid fluorocarbon material (in fine granules or particles), preferably from one of the following: the polymer of tetrafluoroethylene (PTFE), the polymer of fluorinated ethylene propylene (FEP), the polymer of perfluoroalkoxy resin (PFA), or the polymer of ethylene-tetrafluoroethylene (ETFE). The dispersion preferably comprises 40-50% carrying agent. The carrying agent carries the solid fluorocarbon material through and about the braided layer 13. The preferred carrying agent is water, but other suitable carrying agents may be used. In order to keep the fluorocarbon material intermixed with the carrying agent and not from settling out between 0.1-10% by weight surfactant is preferably added to the dispersion. Although many surfactants may be used, such as FLUORAD FLUOROCHEMICAL FC171 (liquid) and FLUORAD FLUOROCHEMICAL FC143 (powder), sold by 3M, SILWETT 77 sold by Union Carbide has been found to work especially well.

35 The fluorocarbon polymer dispersion coats or is dispersed throughout the entire braided layer

13. Specifically, the fluorocarbon polymer dispersion effectively coats each of the glass fibers from the outer periphery radially inward. That is, the glass fibers are coated such that any gap between adjacent fibers will be filled with the dispersion. Also, the outer periphery of each fiber is completely coated. The carrying agent and surfactant are then removed from the dispersion by drying (heating) the hose assembly thereby leaving the fluorocarbon polymer material dispersed throughout the braided layer 13. The assembly is subsequently sintered to cure the fluorocarbon polymer material dispersed throughout the braided layer into a coating 14.

As previously stated, both the inner liner 12 and coating 14 are preferably fluorocarbon polymers. It is, however, not necessary that both the inner liner 12 and the coating 14 be of the same fluorocarbon polymer, although they may be. For example, the inner liner 12 may be made of PFA while the coating 14 is made of PTFE. Any combination of the fluorocarbon polymers previously listed may be utilized for the inner liner 12 and coating 14.

The coating 14 acts as an adhesive to bond the braided layer 13 to the inner liner 12, thus, prohibiting slippage therebetween. Accordingly, the coating 14, in conjunction with the braided layer 13, allows the liner 12 to be bent without kinking. That is, the coating 14, dispersed throughout the braided layer 13, provides strength to the inner liner 12 upon bending. This is commonly referred to as hoop strength. Thus, by

using a polymeric coating 14, dispersed throughout the braided layer 13, a trim profile assembly is produced which results in the hoop strength of the tubular member 11 being increased so that the hose assembly 10 can be bent without kinking the inner the liner 12. Further, the outer coating 14 adds to the working pressure of the hose. That is, the coating 14 provides strength and allows the inner liner 12 to accommodate a fluid under pressure. Also, the coating 14, due to the inherent properties of polymeric fluorocarbon materials therein hinders abrasion of the tubular member. Said another way, the coating 14 aids in the abrasion-resistance of the tubular member 11 and braided layer 13. Because the coating is continuous about the outer periphery of the braided layer 13, the braided layer is not subject to abrasion.

It is important that the dispersion be uniformly distributed about the braided layer 13 and about the inner liner 12 to ensure a secure bond between the inner liner 12 and the braided layer 13, while additionally offering the hose assembly sufficient protection against heat and chemical degradation and abrasion. The addition of the surfactant or wetting agent ensures proper distribution of the dispersion. Uniform distribution of the dispersion is of a particular concern when dealing with a solid fluorocarbon material and a liquid carrying agent dispersion due to fluorocarbon materials general lack of affinity for other materials. That is, due to the inertness of fluorocarbon polymers, they tend not to spread evenly throughout the braided layer 13 and about

the inner liner 12. Additionally, solid fluorocarbon materials tend to settle out from liquid which they may be mixed with. Thus, the use of surfactants are paramount in the distribution of dispersions throughout the braided layer 13 and about the inner liner 12.

The assembly 10 further includes coupling means generally indicated at 20. The coupling means is for connecting the assembly 10 to a fitting (not shown). The fitting is adapted to cooperate with the coupling means 20. Specifically, the coupling means 20 comprises a coupling assembly 20. The coupling assembly 20 includes an insert portion, generally indicated at 22 for inserting into and engaging the interior of the inner liner 12. The insert portion 22 may have a plurality of barbs 24 for engaging the interior of the inner liner 12 (as best shown in Figure 2). Alternatively, the insert portion may have a pair of annular ridges 26 and a smooth portion 28 therebetween, as best viewed in Figure 3. The coupling assembly 20 further includes an engaging portion generally indicated at 30 extending longitudinally from the insert portion. The engaging portion is for engaging a fitting (not shown) and is adapted to cooperate therewith. The engaging portion 30 may comprise a male threaded member 32 (Figure 2) or a female member 34 (Figure 3). The engaging portion 30 may also comprise any configuration adapted to cooperate with a member to which it will be fixed. For example, the engaging portion 30 may comprise a socket to receive a mating ball joint. Finally, the coupling assembly 20 includes a locking collar 36. The locking

collar 36 is disposed about the exterior of the outer coating 14 and is slid over the insert portion 22 of the coupling assembly 20. In this manner, the inner liner 12 is forced into tight frictional engagement with the insert portion 22 to prevent relative axial movement between the inner liner 12 and the insert portion 22. The coupling assembly 20 can be of any other well-known type. For example, the coupling assembly 20 may be of an organic polymeric material and may be molded about the tubular member 11 for a mechanical connection or fusion bond.

As fluid flows through the inner liner 12, electrical charges tend to build throughout the length of the inner liner 12. In order to prevent these electrical charges from accumulating, the inner liner 12 has an integral longitudinal conductive means coextensive with the length of the inner liner 12 for conducting an electrical charge along the liner 12. Preferably, the inner liner 12 has a conductive strip 16 of carbon black. The carbon black is electrically conductive and will dissipate any electrical charge build up by the fluid. Alternatively, the whole inner liner 12 can comprise the conductive means. This is done by using carbon black about the entire inner liner 12.

The braided layer 13 and coating 14 are preferably, electrically non-conductive. This is important in that electrical charges applied to the exterior of the coating 14 will not be conducted throughout the length of the tubular member 11 or to the fluid passing through the interior of the inner liner 12. It will be appreciated that other

conductive material may be used to form the
conductive strip 16.

5 The preferred method for making a hose
assembly 10 as shown is as follows. An inner
organic polymeric tubular member 12 is provided.
Specifically, the inner tubular member 12 of a
fluorocarbon polymer is extruded. A non-metallic
10 or wound material (preferably glass fiber) is then
braided or wound about the exterior of the inner
liner 12 to form a braided layer 13. A dispersion
containing a fluorocarbon polymer material,
carrying agent, and surfactant therein is then
15 applied throughout the braided layer 13 from the
outer periphery radially inwardly toward the inner
liner 12. Specifically, the inner liner 12 and
braided material 13 are passed through a reservoir
containing the dispersion. Alternatively, the
20 dispersion may be sprayed onto the braided
material. Although it is preferred that the
dispersion contain the surfactant therein, the
surfactant may be absent. If such is the case, the
surfactant needs to be applied to the assembly by
25 dipping the assembly in a reservoir containing
surfactant or spraying the surfactant directly
thereon. Preferably, the surfactant would be
applied to the hose assembly prior to applying the
polymeric fluorocarbon dispersion to the hose
30 assembly. That is, regardless of whether the
dispersion contains the surfactant therein,
surfactant may be applied to the hose assembly
prior to applying the dispersion thereto. For
example, the inner tubular liner 12 may be dipped
35 into a reservoir prior to positioning the braided
layer thereabout.

Preferably, the dispersion is an aqueous one including a fluorocarbon polymer material therein. Because the dispersion is preferably aqueous, the preferred carrying agent is water. The dispersion is applied throughout the entire braided layer 13 and about the inner liner 12. The carrying agent and surfactant are then removed from the dispersion. Specifically, the assembly 10 is sent to a dryer (a preheated oven) which is preferably below the boiling temperature of the carrying agent (e.g., for water, below 212° F). By utilizing an oven at a temperature below the boiling temperature of the carrying agent, a bubbling effect is avoided in the final product. The temperature can be above the boiling temperature, however, the assembly 10 may contain many air bubbles in the coating 14 if higher temperatures are used. Subsequently, the surfactant is removed from the dispersion by heating the assembly 10 as discussed above. Generally, higher temperatures are required to remove the surfactant than those required to remove the carrying agent i.e., usually 450-575° F. Thus, once the carrying agent and surfactant are removed from the dispersion, the fluorocarbon material is left dispersed throughout the braided material 13 and about the inner liner 12. The assembly 10 is then sintered at a suitable temperature (roughly 700°F) to cure the fluorocarbon polymer material into a coating 14. Because glass fibers are used for the braided layer 13, the braided layer 13 is unaffected by the heat required to sinter the assembly 10. Finally, a coupling member 20 may be secured on one or both ends of the tubular member 11 to secure the assembly 10 to a fitting (not

shown) for conducting fluid through the inner liner
12.

5 The invention has been described in an
illustrative manner and it is to be understood that
the terminology which has been used is intended to
be in the nature of words of description rather
than of limitation.

10 Obviously, many modifications and
variations of the present invention are possible.
In light of the above teachings, it is therefore to
be understood that within the scope of the appended
claims wherein reference numerals are merely for
15 convenience and are not to be in any way limiting;
the invention may be practiced otherwise than as
specifically described.

What is claimed:

5 1. A method for constructing a hose assembly comprising the steps of:

providing an inner tubular liner (12) of a fluorocarbon polymer;

positioning a braided layer (13) about the exterior of the inner tubular liner (12);

10 said method characterized by the steps of;

applying a dispersion including a fluorocarbon polymer material (14) therein to the braided layer (13) and the inner tubular liner (12); and

15 applying a surfactant to the hose assembly (10) for distributing the dispersion throughout the braided layer (13) and about the inner tubular liner (12).

20 2. A method as set forth in claim 1 further characterized by applying the surfactant to the inner tubular liner (12) prior to positioning the braided layer (13) about the inner tubular liner (12).

25 3. A method as set forth in claim 2 further characterized by applying the surfactant to the inner tubular liner (12) by passing the inner tubular liner (12) through a reservoir containing the surfactant therein.

30 4. A method as set forth in claim 2 further characterized by applying the surfactant to the inner tubular liner (12) by spraying the

35

surfactant about the inner tubular liner (12).

5 5. A method as set forth in claim 1 or
2 wherein the step of applying the dispersion
throughout the braided layer and about the inner
liner is further characterized by passing the inner
tubular liner (12) with the braided layer (13)
disposed thereabout through a reservoir containing
the dispersion.

10 6. A method as set forth in claim 1 or
2 wherein the step of applying the dispersion
throughout the braided layer and about the inner
liner is further characterized by spraying the
15 braided layer (13) positioned about the inner
tubular liner (12) with the dispersion.

20 7. A method as set forth in claim 1
further characterized by the dispersion including
the surfactant intermixed therewith.

25 8. A method as set forth in claim 1 or
2 further characterized by the dispersion including
at least one carrying agent therein for carrying
the fluorocarbon polymer material throughout the
braided layer and about the inner liner (12).

30 9. A method as set forth in claim 8
further characterized by removing the surfactant
and carrying agent from the hose assembly (10)
subsequent to distributing the fluorocarbon polymer
material throughout the braided layer (13) and
about the inner tubular liner (12).

35 10. A method as set forth in claim 9

further characterized by heating the hose assembly to remove the surfactant and carrying agent therefrom.

5 11. A method as set forth in claim 10 further characterized by sintering the hose assembly (10) to cure the polymeric fluorocarbon material into a fluorocarbon polymer coating (14) dispersed throughout the braided layer (13) and
10 about the inner tubular liner (12).

15 12. A method as set forth in claim 11 further characterized by utilizing a non-metallic material for the braided layer (13).

20 13. A method as set forth in claim 12 further characterized by utilizing glass fiber for the braided layer (13).

25 14. A method as set forth in claim 11 further characterized by forming the inner tubular liner (12) by extrusion.

30 15. A method as set forth in claim 7 further characterized by utilizing water as the carrying agent in the dispersion.

35 16. A method as set forth in claim 1 further characterized by securing at least one coupling member (20) on the hose assembly (10) for fastening the hose assembly (10) to a fitting.

 17. A method as set forth in claim 1 further characterized by positioning an integral

conductive means (16) coextensive with the length of the inner liner (12) to conduct an electrical charge along the inner liner (12).

5 18. A method for constructing a hose assembly comprising the steps of: extruding an inner tubular liner (12) comprising a fluorocarbon polymer material; positioning a nonmetallic braided layer (13) about the exterior of the inner tubular
10 liner (12); passing the inner tubular liner (12) having the braided layer (13) thereon through a reservoir containing a dispersion including a fluorocarbon polymer material, water, and surfactant therein; heating the hose assembly (10)
15 to removing the surfactant and water therefrom; and sintering the hose assembly (10) to cure the polymeric fluorocarbon material into a fluorocarbon polymer coating (14) dispersed throughout the braided layer (13) and about the inner tubular
20 liner (12).

25 19. A method as set forth in claim 18 further characterized by applying the surfactant to the inner tubular liner (12) prior to positioning the braided layer (13) about the inner tubular liner (12).

30 20. A method as set forth in claim 18 further characterized by securing at least one coupling member (20) to the assembly for fastening the same to a fitting.

METHOD OF MAKING FLUOROCARBON
COATED BRAIDED HOSE ASSEMBLIES
ABSTRACT OF THE DISCLOSURE

5

10

15

20

25

A method of making a lightweight hose assembly (10) of the type adapted for carrying fuels and other corrosive fluids. The method includes the steps of extruding an inner tubular liner (12) of a fluorocarbon material. Glass fibers are then braided about the exterior of the liner (12) to form a braided layer (13). The inner tubular liner (12) and braided layer (13) are then passed through a reservoir containing a dispersion including a fluorocarbon polymer material, carrying agent, and surfactant therein. The surfactant distributes the fluorocarbon material throughout the braided layer (13) and about the inner liner (12). Subsequently, the assembly (10) is heated to remove the carrying agent and surfactant therefrom. The assembly (10) is then sintered to cure the fluorocarbon polymer material into a coating (14) dispersed throughout the braided layer (13) and about the inner liner (12).
